

Business Performance Analysis — H1 2026

Revenue, Profit, and Marketing Efficiency Across 3 Regions and 3 Products

Executive Summary

Across 18 monthly segments (6 months, 3 regions, 3 products) with no missing data, revenue grew +62% (45,000 → 73,000) and profit grew +89% (19,000 → 36,000), with margin expanding from 42.2% to 49.3%. Growth is concentrated: North/Gamma is the dominant engine, while South is structurally weaker on margin (42.0%) and marketing ROI (217% vs 287% in North). June shows early deceleration (revenue +4.4%, customers +3.9%).

Scope and Methodology

Descriptive analysis of an 18-row dataset (no duplicates, 0% missing) covering Jan–Jun 2026 across regions (North/South/East, 6 each) and products (Alpha/Beta/Gamma, 6 each). Computed month-over-month growth, region and product aggregates, gross margin, ROAS, marketing ROI (profit/marketing_spend *100), Pearson correlations, and an anomaly score. All metrics are derived from figures present in the data profile and analysis notes; no values were imputed.

Key Findings

H1 growth strong but decelerating: Revenue rose 45,000 → 73,000 (+62%) and profit 19,000 → 36,000 (+89%); margin expanded 42.2% → 49.3%. However, monthly growth slowed: revenue +15.95% in Apr → +4.43% in Jun; customers +9.38% → +3.89%. Correlation between customers and revenue is 0.99, and revenue↔profit is 0.98.

North outperforms South on margin and marketing efficiency: North: profit 73,800, margin 48.5%, marketing ROI 287%. South: profit 44,000, margin 42.0%, marketing ROI 217% — a ~70-point gap. East sits between (margin 49.5%, ROI 282%). Cost↔marketing_spend correlation is 0.98, indicating spend scales with cost.

Gamma leads on revenue per customer; one anomalous segment: Gamma delivered the highest revenue per customer (171.6) and total profit (71,100), concentrated in North. A single anomaly was flagged: North/Gamma in Jun 2026 (score 3.86, customers 182, revenue 31,500, profit 15,800) — this segment disproportionately drives H1 totals and warrants data validation.

Recommendations

High. Reallocate roughly 15–20% of South's marketing budget toward North and East over the next quarter. - Each marketing dollar returns 287¢ of profit in North vs 217¢ in South (notes: ROI 287.16% vs 216.75%). Reallocation could lift total profit without increasing spend; target South ROI ≥ 250% within 2 quarters.

High. Diagnose the South/Alpha combination via a 60-day pricing or channel test. - Alpha shows the lowest margin (43.8%) and lowest revenue per customer (153.1) and is concentrated in the weakest region. Notes: South/Alpha margin reported as low as 39.0% with ROAS 5.05; target margin ≥ 45% and ROAS ≥ 5.5.

Medium. Reduce North/Gamma concentration risk and refresh acquisition to counter June deceleration. - North/Gamma drove a large share of H1 profit and is the sole anomaly driver; the falling growth rates (revenue +8% → +4%, customers +7% → +4%) suggest early saturation. Target customer growth ≥ 6%/mo by Q4 and cap North/Gamma at ≤ 40% of total profit.

Limitations and Risks

Sample is only 18 monthly cells — no statistical significance testing. Product↔region mapping is non-random (Beta only in East; Alpha and Gamma appear in phased regions), so region and product effects are partially confounded. Correlations do not imply causation; no attribution model supports marketing ROI as a causal effect. The North/Gamma June anomaly (score 3.86) is a single high-magnitude observation that materially affects aggregates and should be data-validated. Forecasts (Jul 25,561; Aug 26,158; Sep 26,756) are noted but not used.

as findings. No weekly, channel, cohort, or COGS/opex breakdown was available.
